*Note on concepts and sources*

1. The directorate general for economic and financial affairs (DG ECFIN) produces, under its own responsibility, short-term fully-fledged economic forecasts twice a year : in the spring and in the autumn. These forecasts cover the principal macroeconomic aggregates for the Member States, the Candidate Countries, the European Union as a whole, the euro area and the international environment. Interim forecasts, updating the outlook for the seven largest Member States, EU and the euro area, are presented in between the fully-fledged forecasts.
2. Data for 2009, 2010 and 2011 are forecasts.  
The sources for all tables are the Commission services, unless otherwise stated.  
Historical data for the Member States are based on the European System of Accounting (ESA 1995). Most Member States have now introduced chain-linking in their national accounts to measure the development of economic aggregates in volume terms.  
For the USA and Japan the definitions are as in the SNA.
3. Tables 5 and 6 on domestic demand and final demand respectively, present data including inventories.
4. In Tables 16 and 17, the data are based on the national index for USA and Japan, and for EU Member States and aggregates prior to 1996.
5. The potential output gap is calculated with reference to potential output as estimated via a production function, where the increase in the capital stock and the difference between actual unemployment and the NAWRU play a key role.
6. Employment data used in tables 21-25, 27 and 31-32 are based on full-time-equivalents (FTEs), where available. Currently, Germany, Estonia, Spain, France, Italy, Hungary and the Netherlands report FTE data (taken together, these countries represent over 80% of euro-area GDP and more than 60% of EU GDP). In the absence of FTE data, employment is based on numbers of persons. In the calculation of EU and euro-area aggregates, priority is given to FTE data, as this is regarded as more representative of diverse patterns of working time.
7. The nominal short term interest rates are defined as the 3-month inter-bank rates. The nominal long term interest rates are defined as the yield on the central government benchmark 10-year bond. For Estonia, where no appropriate benchmark government bond is available, the indicator provided in Table 34 is a weighted average of MFI interest rates for new EEK-denominated loans to households and non-financial businesses.
8. EU and euro-area data are aggregated using exchange rates. World GDP is aggregated using Purchasing Power Standards (PPS). In the tables on world trade and international payments, the aggregation is carried out on the basis of current exchange rates. Tables 48 - 52, 60 and 61 show also EU and euro-area "adjusted" balances. Theoretically, balances of EU and euro area vis-à-vis third countries should be identical to the sum of the balances of the individual countries in the EU or the euro area. However, intra-EU or intra-euro-area balances are non-zero because of reporting errors. The creation of the internal market in 1993 reduced border controls and formalities, and accordingly the scope and precision of intra-EU trade coverage. Typically, intra-EU imports are underestimated compared to intra-EU exports, leading to an overestimation of the surplus. For the past the "adjusted" balances are Eurostat estimates for EU and ECB estimates for the euro area. For the future, they are ECFIN's forecasts based on the extrapolation of the discrepancies observed in 2008.
